Electron Configurations & Bonds

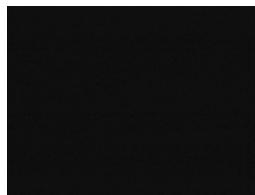

Noble Gases and The Rule of Eight

- δ When two nonmetals react to form a covalent bond: They share electrons to achieve a Noble gas electron configuration.
- δ When a nonmetal and a metal react to form an ionic compound: Valence electrons of the metal are lost and the nonmetal gains these electrons.

Ionic Bonds

- ⇒ Result from electrostatic attractions of closely packed, oppositely charged ions.
- ⇒ Form when an atom which can easily lose electrons reacts with one which has a high electron affinity, that is, it can easily gain electrons.
 - ⇒ Eg. Mg and Cl; K and O

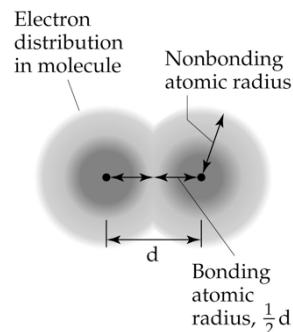

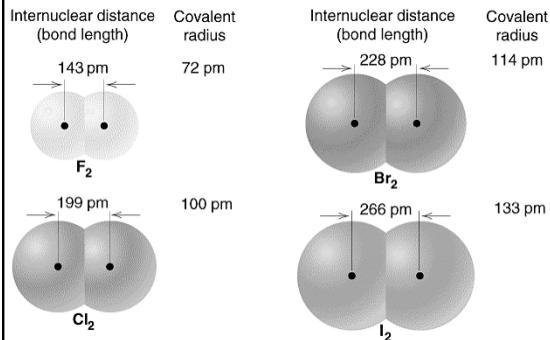

Ionic vs. Covalent Bonding

Bond Length (Covalent Bonds)

- δ Interatomic distance.
- δ It is the distance where the bond energy is at a minimum value, and which is the most stable atomic form.

Bond Lengths and Covalent Radius

Periodic Trends

Atomic Radius

δ Atomic Radii:

What's a picometer?
 $1 \times 10^{-12} \text{ m}$

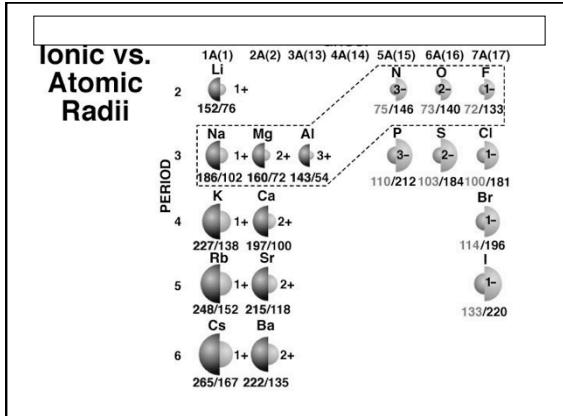

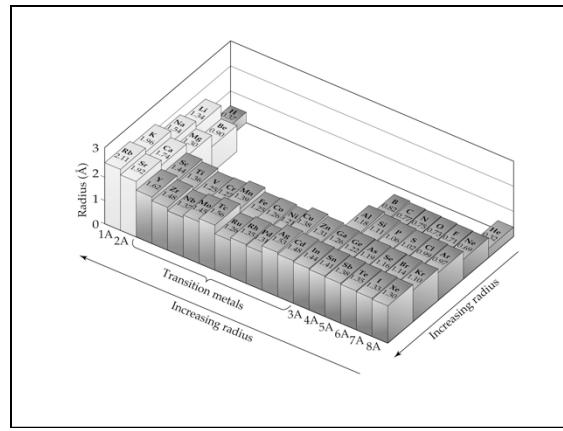

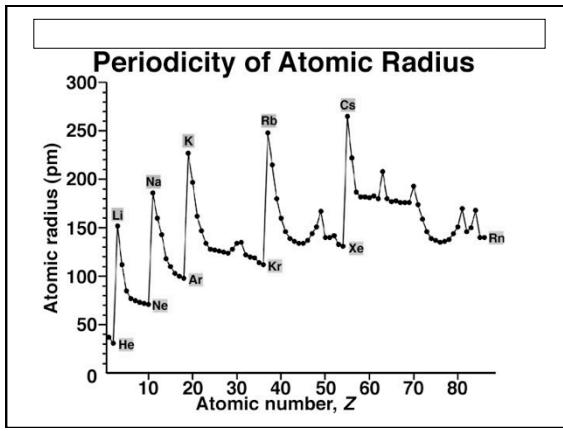

decreases going from left to right across a period;

increases going down a group.

Atomic Radii

Periodic Trends:
 Atomic Radii

QUESTION

Which of the following has the smallest radius?

A) F^-
 B) Ne
 C) O^{2-}
 D) Mg^{2+}
 E) Na^+

Ionization Energy

Ionization Energy

QUESTION

The first ionization energy of Mg is 735 kJ/mol.
The second ionization energy is:

- A) 735 kJ/mol.
- B) less than 735 kJ/mol.
- C) greater than 735 kJ/mol.
- D) More information is needed to answer this question.
- E) none of these.

Periodic Trends

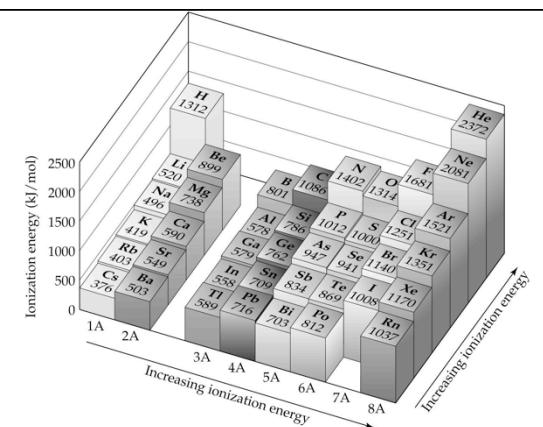

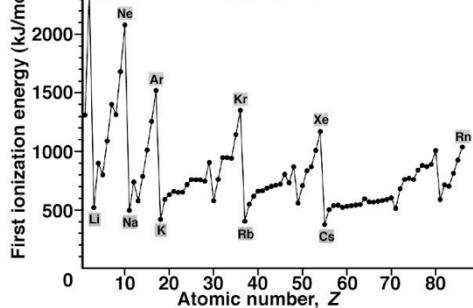

- δ First ionization energy:
 - δ increases from left to right across a Period;
 - δ decreases going down a Group.

QUESTION

Choose the element with the highest IE.

- A) Na
- B) Mg
- C) Al
- D) Si
- E) S

Periodicity of First Ionization Energy (IE_1)

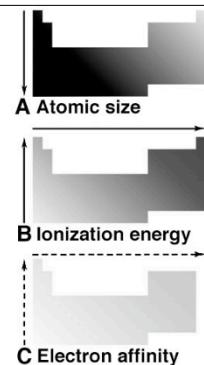

Electron Affinity

δ The energy change associated with the addition of an electron to a gaseous atom.

Trends in Three Atomic Properties

Electronegativity

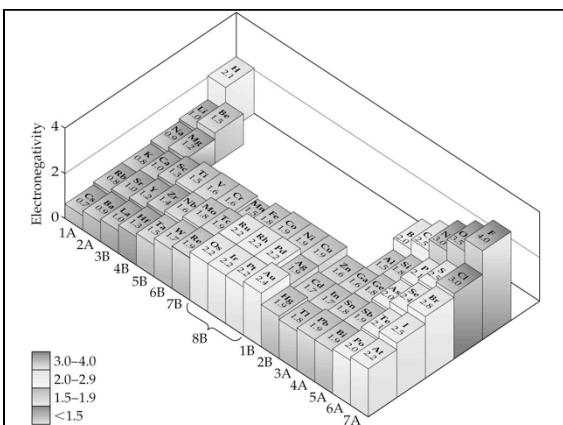

δ The ability of an atom in a molecule to attract shared electrons to itself.

$$\delta \Delta = (H - X)_{actual} - (H - X)_{expected}$$

Electronegativity

Electronegativity

Periodic Trends:
Electronegativity

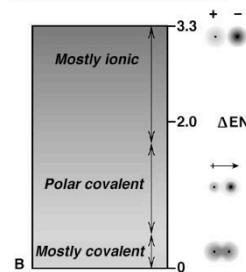

QUESTION

For the elements Rb, F, and O, the order of increasing electronegativity is:

- A) Rb < F < O.
- B) Rb < O < F.
- C) O < F < Rb.
- D) F < Rb < O.
- E) none of these.

Boundary Ranges for Classifying Ionic Character of Chemical Bonds

ΔEN	Ionic Character
>1.7	Mostly ionic
0.4-1.7	Polar covalent
<0.4	Mostly covalent
0	Nonpolar covalent

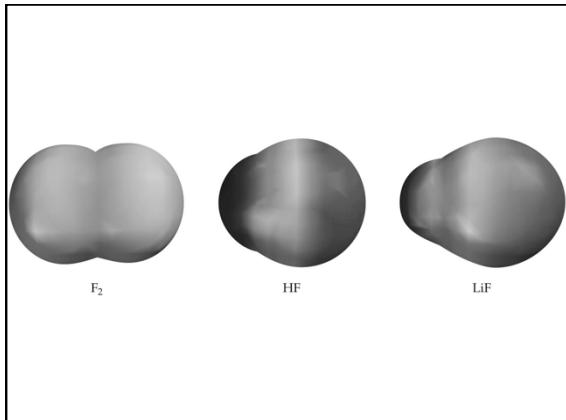

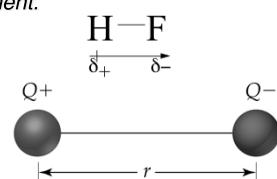

QUESTION

Atoms having greatly differing electronegativities are expected to form:

- A) no bonds.
- B) polar covalent bonds.
- C) nonpolar covalent bonds.
- D) ionic bonds.
- E) covalent bonds.

Covalent Bond Polarity

A molecule, such as HF, that has a center of positive charge and a center of negative charge is said to be polar, or to have a dipole moment.

QUESTION

Choose the compound with the most ionic bond.

- A) LiCl
- B) KF
- C) NaCl
- D) LiF
- E) KCl

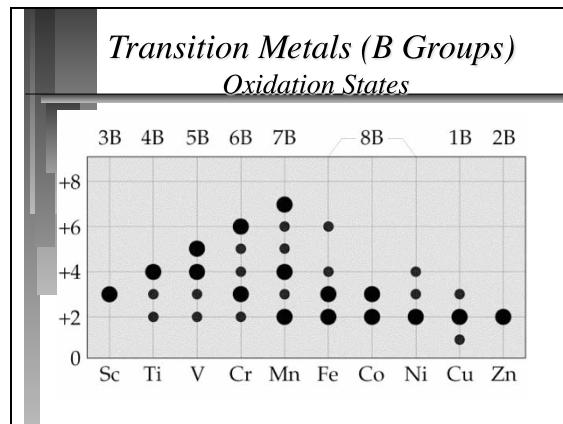

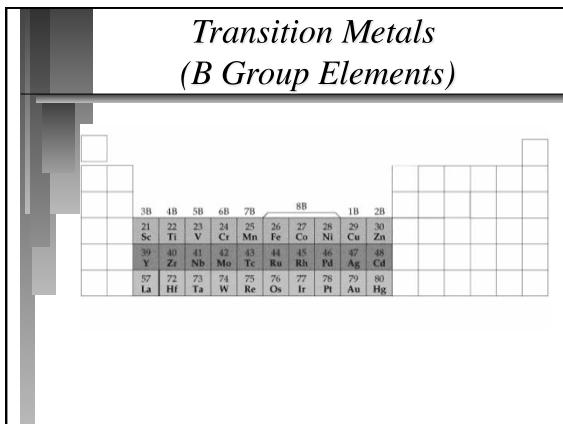

Element	Electron Configuration	Melting Point (°C)	Density	Atomic Radius (Å)	I_1 (kJ/mol)
Fluorine	[He]2s ² 2p ⁵	-220	1.69 g/L	0.71	1681
Chlorine	[Ne]3s ² 3p ⁵	-102	3.21 g/L	0.99	1251
Bromine	[Ar]3d ¹⁰ 4s ² 4p ⁵	-7.3	3.12 g/cm ³	1.14	1140
Iodine	[Kr]4d ¹⁰ 5s ² 5p ⁵	114	4.93 g/cm ³	1.33	1008

Trends in Reactivity

Lithium (Li), Sodium (Na) & Potassium (K)

What is trend in the chemical reactivity observed for the alkali metals, Group IA?

- What might account for this trend?
- Do you expect the Alkaline Earths (Group IIA) to behave similarly?
- Does this trend apply to all Groups?

Information & the Periodic Table

A great deal of specific, general and comparative information can be developed from the Periodic Table:

- δ 1. Group valence electron configurations.
- δ 2. Individual electron configurations.
- δ 3. General chemical behavior and physical properties.
- δ 4. Distinguishing metals and nonmetals.

Summary of Periodic Trends

Periods (Horizontal Rows)

- δ **Atomic size** generally decreases across a Period.
- δ The **first ionization energy** and **electronegativity** generally increase across a Period..

This is a result of **increasing effective nuclear charge** and electrons being in the **same principal energy level**.

Summary of Periodic Trends
Periods (Horizontal Rows)

- Metallic character decreases as elements change from metals to metalloids to nonmetals.
- General reactivity is highest at the left and right ends of a Period. (Excluding the inert noble gases.)
- In Period 2, the physical properties change abruptly between carbon (solid) and nitrogen (gas).
