

**Visible Spectroscopy**  
*Beer's Law*

**Transitions between energy states**

$\Delta E = h\nu$

Gaps between electron energy levels correspond to wavelengths; between 200 and 800 nm (Ultraviolet-Visible)

**Absorption and Emission of Light**

Absorption

Emission

(Dropping from an excited state to ground state or lower state)

(Excitation from ground state or from an excited state to a higher state)

**Spectrophotometer**

**Attenuation of Light**

$$T = \frac{P}{P_0}$$

$$A = \log \frac{P_0}{P}$$

Absorbing solution of concentration c

**Transmittance vs. Absorbance**

Transmittance scale is linear  
Absorbance scale is exponential

% T	A
0	2.0
10	1.0
20	0.8
30	0.7
40	0.6
50	0.5
60	0.4
70	0.3
80	0.2
90	0.1
100	0.05
	0.005

### The Spectrum

---

- The spectrometer measures the intensity of a reference beam ( $P=I_0$ ) and the intensity of a beam through a sample ( $P=I_s$ ).
- Absorbance is the log of the ratio  $\frac{I_0}{I_s}$
- Graph is absorbance vs. wavelength.

### Beer's Law

---

- Graph is absorbance vs. concentration.
- Beer's Law:  
 $A = \epsilon cl$ ;  $A = abc$   
 $\epsilon$  ( $a$ ) is the molar absorptivity,  $c$  is the sample concentration in moles per liter, and  $l$  ( $b$ ) is the length of the light path in centimeters.

### Beer's Law $A = \epsilon bc$

---

Path Length Dependence,  $b$

### Beer's Law $A = \epsilon bc$

---

Path Length Dependence,  $b$

### Beer's Law $A = \epsilon bc$

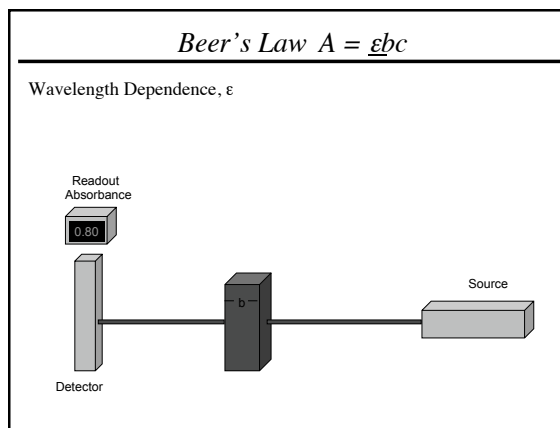

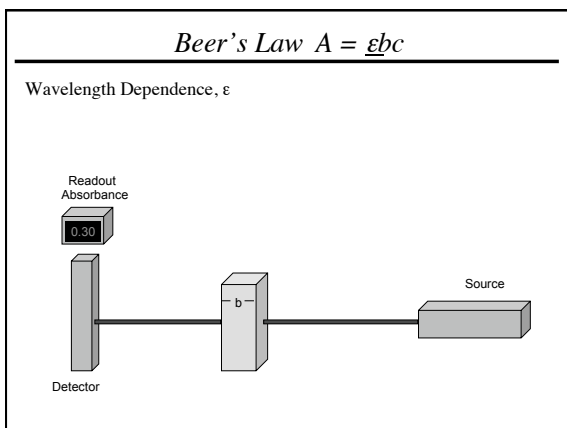

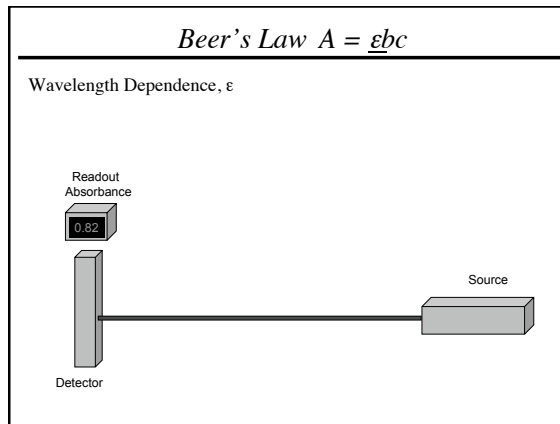

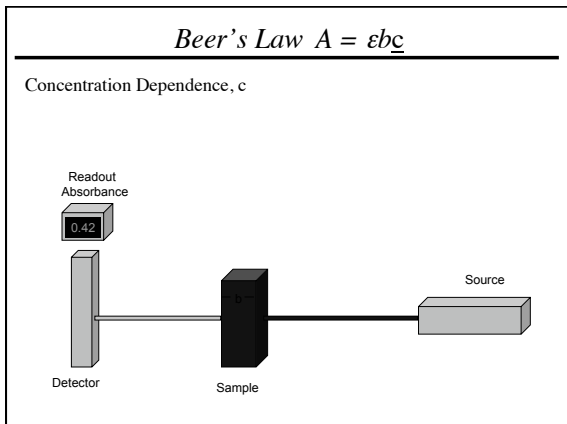

---

Concentration Dependence,  $c$

### Beer's Law $A = \epsilon bc$

---

Concentration Dependence,  $c$

**Prelab Calculation**

---

What is the manganese concentration in a sample that has an absorbance of 0.658, a path length of 1.50cm and a molar absorptivity,  $\epsilon = 5.85 \times 10^3 \text{ L/mol} \cdot \text{cm}$ .

$A = \epsilon b c$

A.  $3.85 \times 10^3 \text{ M MnO}_4^-$   
 B.  $1.12 \times 10^{-4} \text{ M MnO}_4^-$   
 C.  $7.50 \times 10^{-5} \text{ M MnO}_4^-$   
 D.  $1.69 \times 10^{-4} \text{ M MnO}_4^-$
