

Water is:

Oceans, glaciers, seas, rivers, streams, rain, sleet, snow, ice, clouds, fog, steam, dew.....

Water comes from hoses, pipes, faucets, bottles, the sky, waterfalls,the loo [*commode, head, can, john, toilet*]

Water is:

a single "molecule" made up of a trio of very, very tiny "atoms",
too small to see with just eyes, but very imaginable.

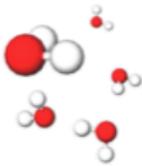

Imagine

twin white "hydrogen" marbles attached @ an angle to a single larger red "oxygen",
the molecule's proper scientific name is

dihydrogen monoxide,

but even scientists don't use its proper name;

It's just referred to as **WATER**

Water is VERY, VERY important; without water life CANNOT exist.

It carries life in all of its kingdoms with all of the stuff that life needs along its many, many different paths & journeys.....

[unfortunately, the bad stuff can come along with the good]

in all plants & animals, and from the largest to the smallest invisible microbes
.....from the past to the present & future for generations of all living things.

THEREFORE

Best to take very, very good care of **water!!!!!!**
