Millikan Oil Drop Experiment

How does an atom relate to nanotechnology?

Consider Powers of 10 (10^x)

http://www.eamesoffice.com/powers_of_ten/powers_of_ten.html

<http://www.powersof10.com/>

Earth = 12,760,000 meters wide
 (12.76×10^6), 12.76 million meters (megameters)

Plant Cell = 0.00001276 meters wide (12.76×10^{-6})
 (12.76 millionths of a meter)
 (12,760 nanometers!)

Nano scale is regarded as $< 1,000$ nanometers $\sim 1/50$ the diameter of a human hair (anything less than a micron (10^{-6} m)). Chemists typically think in views and images of < 1 nanometer (eg. bond lengths and atomic sizes).

General Features of the Atom

Anders Jöns Ångström
 (1814-1874)
 $1 \text{ \AA} = 10 \text{ picometers} = 0.1 \text{ nanometers} = 10^{-4} \text{ microns} = 10^4 \text{ centimeters}$

- $1 \text{ nm} = 10 \text{ \AA}$
- An atom vs. a nucleus $\sim 10,000 \times$ larger

Can we "see" and manipulate atoms using a microscope?

Yes, using atomic force microscopy (AFM) and a variety of instruments such as Scanning Transmission Electron Microscopes.

TEAM 0.5:
 LBL's Latest (2008)
 Transmission Electron
 Aberration-corrected
 Microscope
 Resolution:
 +/- 0.5 Å

- 1 nm = 10 Å
- An atom vs. a nucleus
 ~10,000 x larger

Atomic/molecular structures atom-by-atom

Building of a quantum "corral" with Fe atoms on Cu

Xe atoms on Ni(110)

STM images courtesy of Don Eigler, IBM, San Jose

Imaging: acetylene on Pd(111) at 28 K

Molecular Image
 Tip cruising altitude ~700 pm
 $\Delta z = 20$ pm

Why don't we see the Pd atoms?
 Because the tip needs to be very close to image the Pd atoms and would knock the molecule away

Surface atomic profile
 Tip cruising altitude ~500 pm
 $\Delta z = 2$ pm

Calculated image (Philippe Sautet)

If the tip was made as big as an airplane, it would be flying at 1 cm from the surface and waving up an down by 1 micrometer

The STM image is a map of the pi-orbital of distorted acetylene

M. Salmeron (LBL)

Excitation of frustrated rotational modes in acetylene molecules on Pd(111) at T = 30 K

Tip

e^-

π orbital

M. Salmeron (LBL)

CHEMISTRY of the Atom

FUNDAMENTAL PARTICLES:

	Mass	Charge	Symbol
Nucleus:			
δ PROTON	1 amu	+1	H+, H, p
	• 1.67×10^{-27} kg		
δ NEUTRON	1 amu	0	n
	• 1.67×10^{-27} kg		
<hr/>			
δ ELECTRON	very small	-1	e ⁻
	• ~ 2000 x smaller than a proton or neutron		
The particle is said to "hold" or "bond" atoms together in molecules.

Alkali metals, Alkaline earth metals, Transition metals, Post-transition metals, Metalloid, Lanthanides, Actinides, Nonmetals, Halogens, Noble gases

QUESTION

The element found in the 6A family (or group 16) and period four can be toxic, a micronutrient, and found in compounds in dandruff shampoos. What is the symbol for that element?

- A. Sb
- B. As
- C. Se
- D. Te

Chemical Symbols & Historical Names

The Symbols for the Elements That Are Based on the Original Names

Current Name	Original Name	Symbol
Antimony	Stibium	Sb
Copper	Cuprum	Cu
Iron	Ferrum	Fe
Lead	Plumbum	Pb
Mercury	Hydrargyrum	Hg
Potassium	Kalium	K
Silver	Argentum	Ag
Sodium	Natrium	Na
Tin	Stannum	Sn
Tungsten	Wolfram	W

What is the symbol for gold and what was its original name?

QUESTION

Which of the following names and symbols are incorrectly paired?

- A. Phosphorus, Ph
- B. Palladium, Pd
- C. Platinum, Pt
- D. Lead, Pb
- E. Potassium, K

Metals, Metalloids, and Nonmetals

QUESTION

Of the following which would not be considered a metalloid?

- A. Ge
- B. Sb
- C. Te
- D. Se
- E. As

Periodic Table

Elements are classified by:

properties & atomic number
metals, non-metals, metalloids

Groups or Families (vertical)

1A = alkali metals

2A = alkaline earth metals

6A (16) = chalcogens

7A (17) = halogens

8A (18) = noble gases

Periods (horizontal) numbers 1-7

QUESTION

Select the correct statement relative to the modern periodic table.

- A) Tin is a transition element.
- B) Lead is a nonmetal.
- C) Antimony is a metalloid.
- D) Elements are arranged in order of increasing atomic mass.
- E) Sulfur is a halogen.

Group 1 and Group 2 Metals

Using the Periodic Table

Atoms, Molecules & Ions

δ **Atoms** (neutral electrostatic charge: # protons = # electrons)

- # Protons = Atomic Number
- Atomic Mass = # Protons + # of Neutrons
- Isotope: same atomic number but different atomic mass (different # of neutrons)

QUESTION

Which among the following represent a set of isotopes? Atomic nuclei containing:

- 20 protons and 20 neutrons.
 - 21 protons and 19 neutrons.
 - 22 neutrons and 18 protons.
 - 20 protons and 22 neutrons.
 - 21 protons and 20 neutrons.
- a, b, c
 - c, d
 - a, e
 - a, d and b, e
 - No isotopes are indicated.

Atoms, Molecules & Ions

- Isotopes vary in their relative natural abundance.
- Periodic Table's atomic mass is a weighted average of all isotopic masses
- The mass of sodium, Na, element #11 is listed as 22.99 amu. Which isotope is naturally present in the larger amount: the isotope with 12 neutrons or with 13 neutrons? (There is a small percentage of the isotope with 11 neutrons.)

QUESTION

Two stable isotopes of an element have isotopic masses of 10.0129 amu and 11.0093 amu. The atomic mass is 10.81. Which isotope is more abundant?

- A) There is insufficient information to answer the question.
- B) There are equal amounts of each isotope.
- C) The isotope with a mass of 10.0129 amu is more abundant.
- D) The isotope with a mass of 11.0093 amu is more abundant.

Atoms, Molecules & Ions

Atomic Mass of Carbon:

Exact Mass	% Occurrence
12.00000	98.98
13.00335	1.011
14.00	negligible

What is the "weighted" atomic mass?

QUESTION

The two major isotopes of bromine are ^{79}Br and ^{81}Br . Assume that the masses of the ^{79}Br and ^{81}Br isotopes are 79.00 and 81.00 amu, respectively. The weighted average atomic mass of bromine is 79.90 amu.

What are the relative % abundances of each isotope?

	<u>% Abundance of ^{79}Br</u>	<u>% Abundance of ^{81}Br</u>
A.	79.0%	21.0%
B.	19.0%	81.0%
C.	35.1%	64.9%
D.	55.0%	45.0%

Atoms, Molecules and Ions

- Atomic Number = 6 (atom's identity)
- Carbon
- Atomic Mass = 13 (isotope 13)
- 6 protons; # neutrons = 13 - 6
- neutral atom has 6 electrons

QUESTION

The average mass of a carbon atom is 12.011. Assuming you were able to pick up only one carbon unit, the chances that you would randomly get one with a mass of 12.011 is

- A. 0%.
- B. 0.011%.
- C. about 12%.
- D. 12.011%.
- E. greater than 50%.

Atomic Symbols

Mass number \rightarrow ^{39}K \leftarrow Element Symbol
Atomic number \rightarrow ^{19}K

Also written as \rightarrow ^{39}K

Atoms, Molecules and Ions

- Atomic Number = 12 (atom's identity)
- Atomic Mass = 24
- 12 protons; # neutrons = 24 - 12
- neutral atom has 12 electrons
- Ion contains 10 electrons: symbol?

Atoms, Molecules and Ions

- Atomic Number = 17 (atom's identity)
- Atomic Mass = ?
- # protons = ? ; # neutrons = ?
- neutral atom has ? electrons
- Ion contains 18 electrons: symbol?

Ions

- δ *Cation: A positive ion*
 - δ Mg^{2+}, NH_4^+
- δ *Anion: A negative ion*
 - δ Cl^-, SO_4^{2-}
- δ *Ionic Bonding: Force of attraction between oppositely charged ions.*

QUESTION

Calcium plays several critical roles in the functioning of human cells. However, this form of calcium is the ion made with 20 protons and 18 electrons. Therefore the ion would be...

- A. positive and called an anion.
- B. positive and called a cation.
- C. negative and called an anion.
- D. negative and called a cation.

QUESTION

Of the following, which would NOT qualify as an isotope of ^{35}Cl ?

- A. ^{36}Cl
- B. $^{35}\text{Cl}^-$
- C. $^{37}\text{Cl}^-$
- D. ^{37}Cl

Worksheet: Atoms I

(Lab Manual)

Nuclear Symbol	Number of Protons	Number of Neutrons	Number of Electrons	Atomic Number (Z)	Mass Number (A)
$^{12}_6\text{C}$	6	6	6	6	12
$^{14}_7\text{N}$			7		
	7	8	7		
			18	20	40
$^{17}\text{O}^{2-}$				8	
^{56}Fe			26		
$^{19}\text{F}^-$				9	

Molecules

- δ *Neutrally Charged*
- δ *Eg. Salt: NaCl -> 1 Na⁺ and 1 Cl⁻*
- δ *What is the proportion of ions for a compound formed from Mg ion and chlorine?*
- δ *Mg²⁺ and Cl⁻*
- δ *1 Mg²⁺ combines with 2 Cl⁻*

The Relationship Between Ions Formed and the Nearest Noble Gas

5A (15)	6A (16)	7A (17)	8A (18)	1A (1)	2A (2)	3A (13)
		H ⁻	He	Li ⁺		
N ³⁻	O ²⁻	F ⁻	Ne	Na ⁺	Mg ²⁺	Al ³⁺
	S ²⁻	Cl ⁻	Ar	K ⁺	Ca ²⁺	
		Br ⁻	Kr	Rb ⁺	Sr ²⁺	
		I ⁻	Xe	Cs ⁺	Ba ²⁺	

Ionic vs. Covalent

Ionic vs. Covalent

- δ *Metals generally combine with non-metals to form ionic compounds. Electrons are "lost" by the metal and "gained" by the non-metal following the octet rule.*
- δ *Non-metals generally combine with non-metals to form covalent compounds where electrons are "shared". Each pair of electrons is a covalent bond. Eg. H₂O*
- δ *Polyatomic ions have both covalent and ionic properties. Eg. hydroxide, OH⁻*

QUESTION

All of the following are true except:

- A. Ions are formed by adding electrons to a neutral atom.
- B. Ions are formed by changing the number of protons in an atom's nucleus.
- C. Ions are formed by removing electrons from a neutral atom.
- D. An ion has a positive or negative charge.
- E. Metals tend to form positive ions.

Chemical Formulas

δ *Molecular Formula:*

Elements' Symbols = atoms

Subscripts = relative numbers of atoms

δ *How many atoms of each element are in the following compounds?*

$MgCl_2$ CCl_4 $NaOH$ $(NH_4)_2CO_3$

$C_{20}H_{26}N_2O$ (*Ibogaine, not ionic*)

QUESTION

How many oxygen atoms are there in one formula unit of $Ca_3(PO_4)_2$?

- A. 2
- B. 4
- C. 6
- D. 8
- E. None of these
